GOOGLE CLOUD AI BUILDER CUP 2026 · MEDIA, CONTENT & DIGITAL EXPERIENCES · TEAM SEEN

SEEN

Women's cricket does not need more content. It needs to be seen.

The Unseen XI: every week, the eleven women cricketers whose performance most exceeds the attention they get — found in public data, written by Gemini from locked facts, verified figure by figure, delivered in the fan's language, and measured.

Sainath Gaikwad · Sharvari Otari · a working prototype on live public data, hosted on Cloud Run

Proposal deck · October 2026 · live prototype (Cloud Run) and the 3-minute demo video are linked in the submission form

THE PROBLEM, MEASURED

The 2025 World Cup drew 5.2bn video views. At the 2026 T20 World Cup, the tournament's best player was only its 52nd most-viewed.

Hayley Matthews

West Indies · 145 runs, 10 wickets

Impact rank

#1

Attention rank

#52

6,111 article views

Ellyse Perry

Australia · 278 impact points

Impact rank

#8

Attention rank

#3

58,451 article views — 9.6× Matthews

59% of all attention went to the 42 players from India, England and Australia — a quarter of the 165 athletes

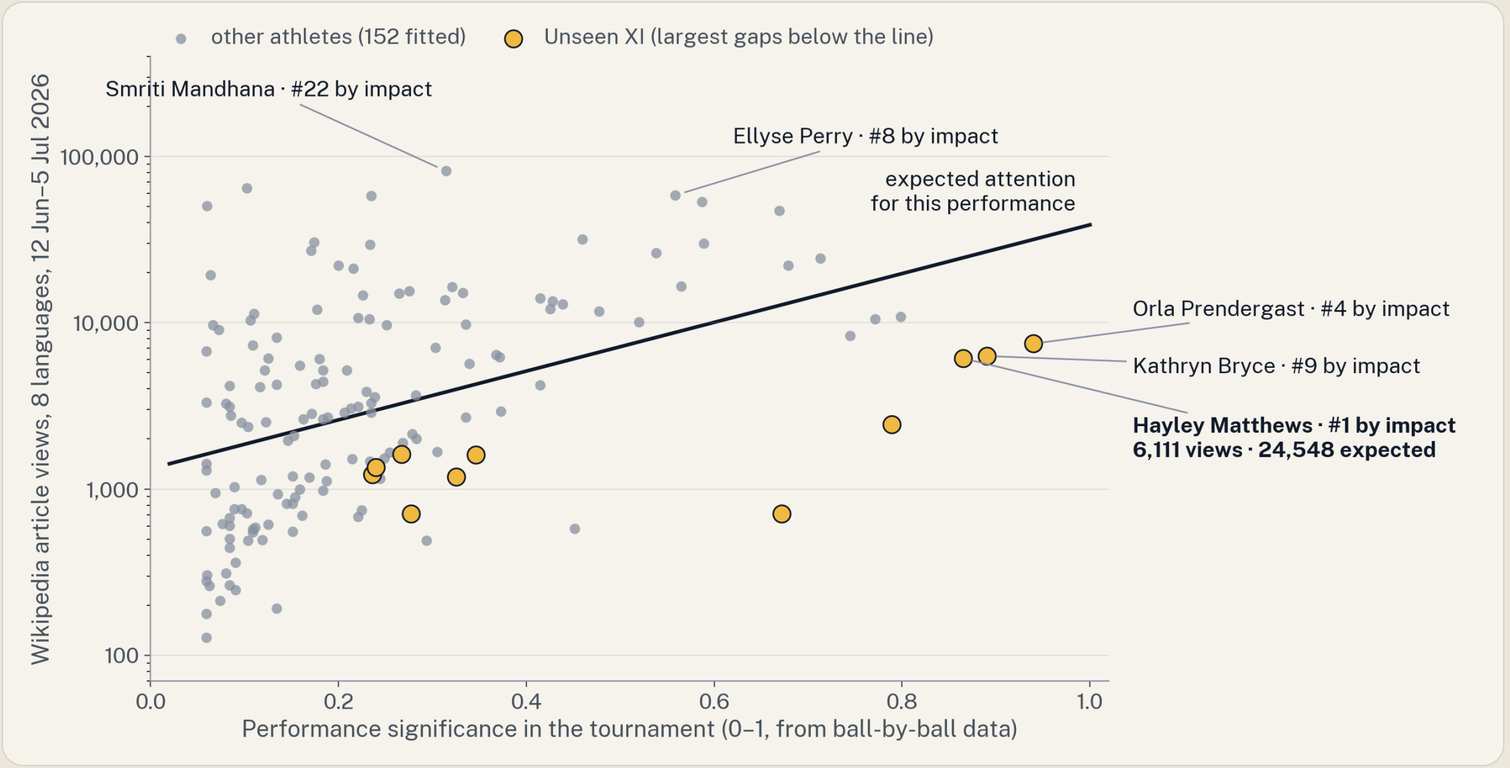

20 of 40 of the tournament's best performers drew under 10,000 article views across eight languages

60% of a year's women's-sport viewing in the UK comes from two tournaments; 40% of teenagers cannot name a sportswoman

Sources: our analysis — Wikimedia Pageviews API, 8 language editions, 12 Jun–5 Jul 2026, and Cricsheet ball-by-ball data (ODC-BY), 165 athletes; ICC digital records, 27 Nov 2025; Women's Sport Trust, More Than A Moment; Hark Fan Gap study, Mar 2026.

THE INSIGHT

How she played explains 20% of her attention. Who she already was explains 81%.

R^2 0.20

Performance alone: rarity, stakes, magnitude and arc of what she did, from ball-by-ball data. That is the line on the chart.

R^2 0.81

Add home-market size and her pre-tournament baseline. Attention follows who she already was, not what she just did.

The distance below the line is the part ICC's own distribution can change: athlete by athlete, market by market, every week.

Two ordinary least-squares fits on log article views, n = 152 athletes with a Wikipedia article and complete attention data. Coverage studies are annual and aggregate; this is continuous, athlete-level and actionable.

WHAT SEEN DOES

Find her. Verify the story. Route it through ICC. Prove it worked.

01
Find her

Ball-by-ball data becomes a graph, 10 narrative patterns and a significance score. Wikipedia views in 8 languages say who fans looked up. The residual is her gap.

02
Pick the Unseen XI

Eleven a week: at most three per country, at least three from outside India, England and Australia, consent-gated, 14-day cooldown, a reason for each pick.

03
Verify the story

Fact-locked kits in 8 formats, from a 60-second script to a sponsor hook, then in the fan's language. A claim checker blocks any number without a fact ID.

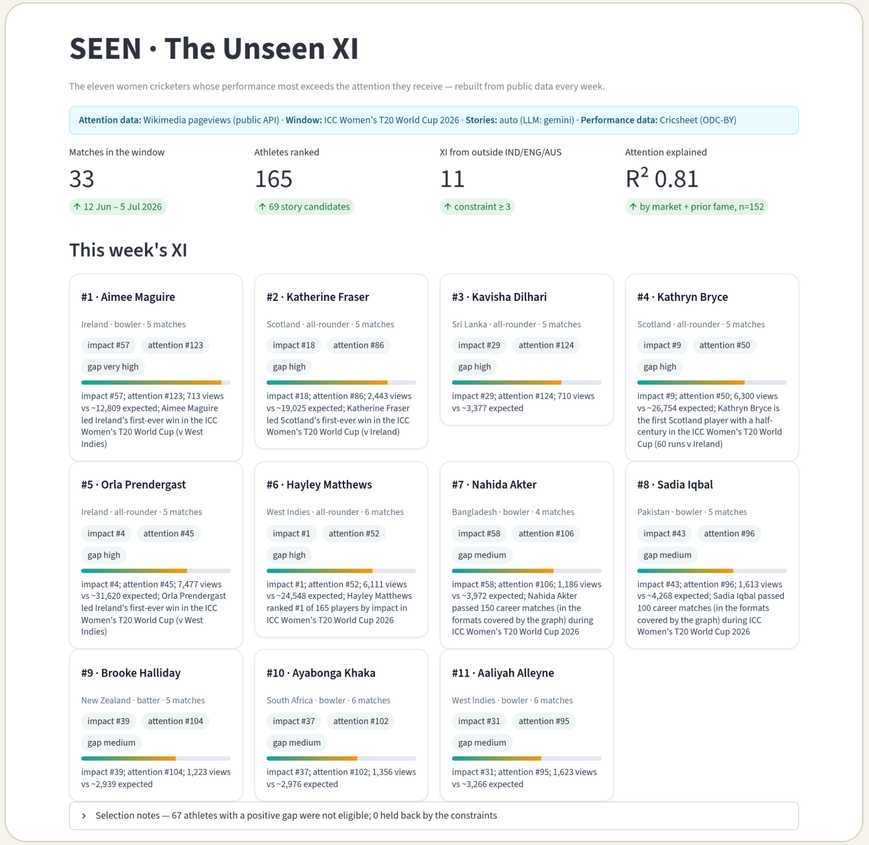

04
Route and prove

Creator Club briefs, app cards, commentary packs, a fan feed. Attention lift is measured against matched controls; the loop reweights what converts.

No number is written by a model. Every figure traces to a fact from the graph, and an athlete-safety gate — consent, opt-out, no minors without board consent, banned topics — sits before publication.

IT RUNS TODAY

On live public data the prototype found the gap and named the athletes in it

SEEN · The Unseen XI

The eleven women cricketers whose performance most exceeds the attention they receive — rebuilt from public data every week.

Attention data: Wikimedia pageviews (public API) · **Window:** ICC Women's T20 World Cup 2026 · **Stories:** auto (LLM: gemini) · **Performance data:** Cricsheet (ODC-BY)

Matches in the window	Athletes ranked	XI from outside IND/ENG/AUS	Attention explained
33	165	11	R^2 0.81
↑ 12 Jun – 5 Jul 2026	↑ 69 story candidates	↑ constraint ≥ 3	↑ by market + prior fame, n=152

This week's XI

#1 · Aimee Maguire
Ireland · bowler · 5 matches
impact #57 · attention #123 · gap very high
impact #57; attention #123; 713 views vs ~12,809 expected; Aimee Maguire led Ireland's first-ever win in the ICC Women's T20 World Cup (v West Indies)

#2 · Katherine Fraser
Scotland · all-rounder · 5 matches
impact #18 · attention #86 · gap high
impact #18; attention #86; 2,443 views vs ~19,025 expected; Katherine Fraser led Scotland's first-ever win in the ICC Women's T20 World Cup (v Ireland)

#3 · Kavisha Dilhari
Sri Lanka · all-rounder · 5 matches
impact #29 · attention #124 · gap high
impact #29; attention #124; 710 views vs ~3,377 expected

#4 · Kathryn Bryce
Scotland · all-rounder · 5 matches
impact #9 · attention #50 · gap high
impact #9; attention #50; 6,300 views vs ~26,754 expected; Kathryn Bryce is the first Scotland player with a half-century in the ICC Women's T20 World Cup (60 runs v Ireland)

#5 · Orla Prendergast
Ireland · all-rounder · 5 matches
impact #4 · attention #45 · gap high
impact #4; attention #45; 7,477 views vs ~31,620 expected; Orla Prendergast led Ireland's first-ever win in the ICC Women's T20 World Cup (v West Indies)

#6 · Hayley Matthews
West Indies · all-rounder · 6 matches
impact #1 · attention #52 · gap high
impact #1; attention #52; 6,111 views vs ~24,548 expected; Hayley Matthews ranked #1 of 165 players by impact in ICC Women's T20 World Cup 2026

#7 · Nahida Akter
Bangladesh · bowler · 4 matches
impact #58 · attention #106 · gap medium
impact #58; attention #106; 1,186 views vs ~3,972 expected; Nahida Akter passed 150 career matches (in the formats covered by the graph) during ICC Women's T20 World Cup 2026

#8 · Sadia Iqbal
Pakistan · bowler · 5 matches
impact #43 · attention #96 · gap medium
impact #43; attention #96; 1,613 views vs ~4,268 expected; Sadia Iqbal passed 100 career matches (in the formats covered by the graph) during ICC Women's T20 World Cup 2026

#9 · Brooke Halliday
New Zealand · batter · 5 matches
impact #39 · attention #104 · gap medium
impact #39; attention #104; 1,223 views vs ~2,939 expected

#10 · Ayabonga Khaka
South Africa · bowler · 6 matches
impact #37 · attention #102 · gap medium
impact #37; attention #102; 1,356 views vs ~2,976 expected

#11 · Aaliyah Alleyne
West Indies · bowler · 6 matches
impact #31 · attention #95 · gap medium
impact #31; attention #95; 1,623 views vs ~3,266 expected

› Selection notes — 67 athletes with a positive gap were not eligible; 0 held back by the constraints

The Unseen XI · ICC Women's T20 World Cup 2026

Aimee Maguire (Ireland) · Katherine Fraser (Scotland) · Kavisha Dilhari (Sri Lanka) · Kathryn Bryce (Scotland) · Orla Prendergast (Ireland) · Hayley Matthews (West Indies) · Nahida Akter (Bangladesh) · Sadia Iqbal (Pakistan) · Brooke Halliday (New Zealand) · Ayabonga Khaka (South Africa) · Aaliyah Alleyne (West Indies)

Eight countries. None from India, England or Australia: 38 of their 42 players sat above the expected-attention line; of the other four, three ranked outside the top 60 by impact and one had a smaller gap than any of the eleven.

165 athletes · 33 matches

ranked against 3,577 Cricsheet matches of history; 69 story candidates from 10 narrative patterns

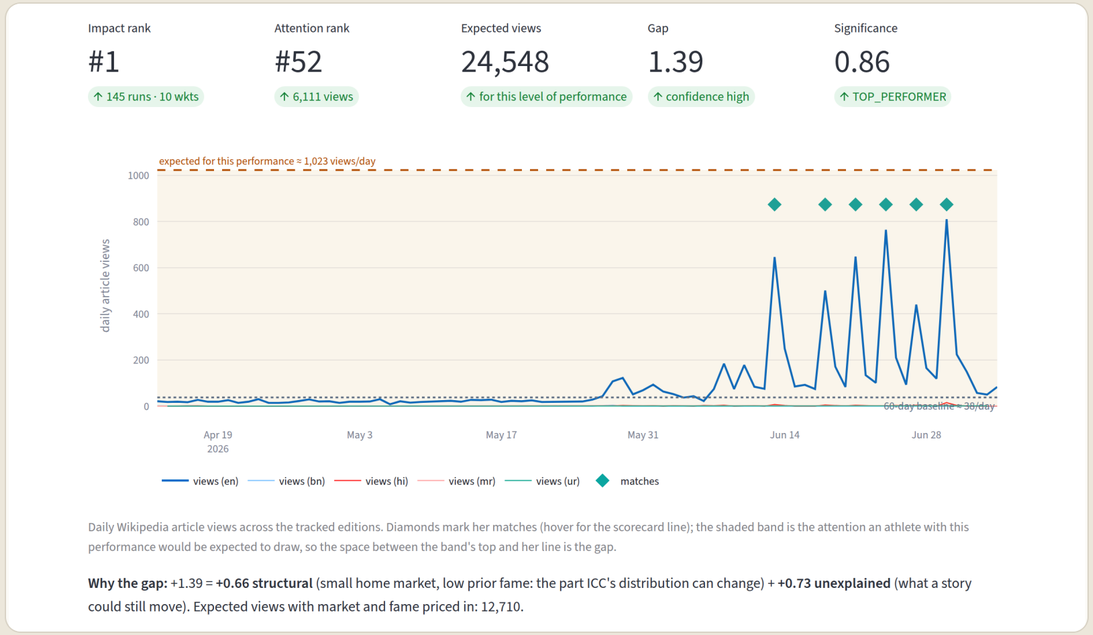

88 of 88 checks passed

11 kits × 8 formats, every number matched to a fact; attention from 8 Wikipedia editions; kits localised to Hindi and Urdu

One command rebuilds everything from public sources: Cricsheet (ODC-BY) → DuckDB graph → patterns → Wikidata + Wikimedia Pageviews → two-line gap model → XI → kits → claim checker → app. Run of 26 Sep 2026.

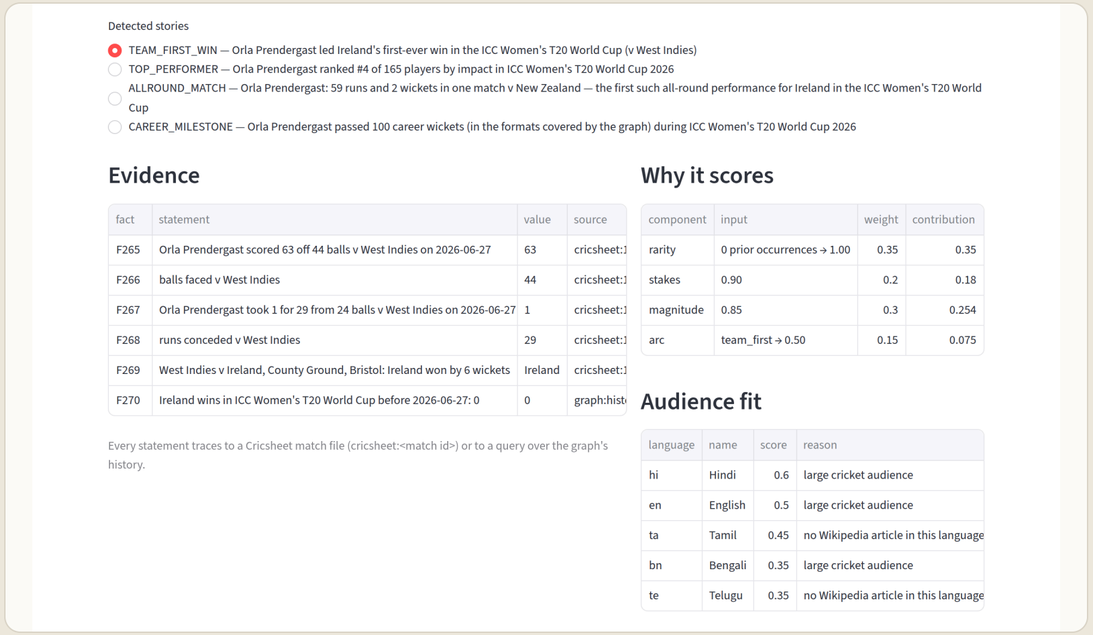

THE PROTOTYPE · 1 OF 3

Find her, then show why she matters

Athlete profile

Her matches against her daily attention, the level an athlete with this performance would be expected to draw, and the gap split into what market and prior fame explain and what a story could still move.

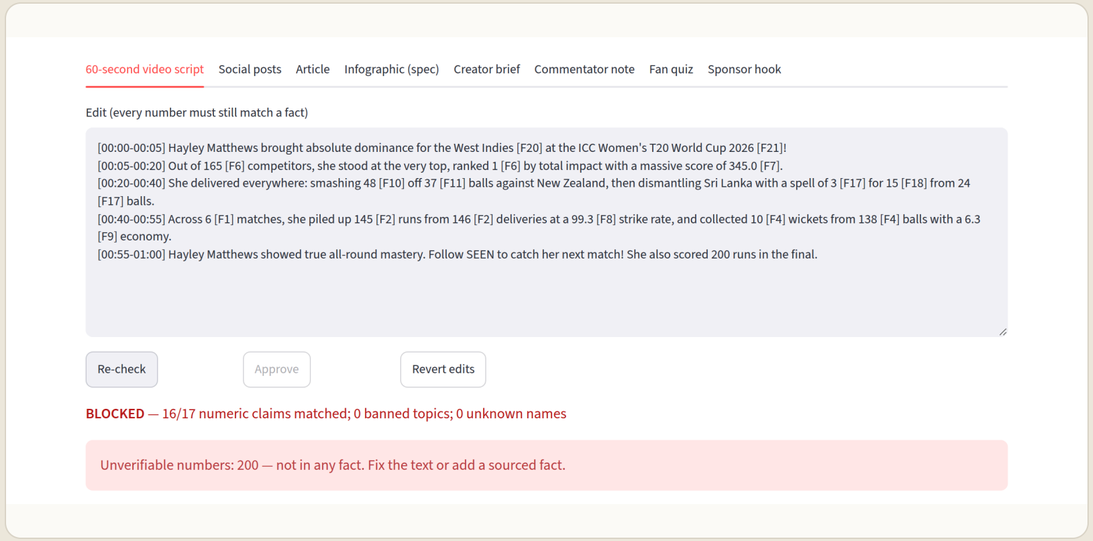

Story opportunity

The pattern the graph detected, every fact behind it with its Cricsheet source, the significance score broken into rarity, stakes, magnitude and arc, and the languages where the story would travel furthest.

Screens from the Streamlit prototype, run of 26–29 Sep 2026 on the ICC Women's T20 World Cup 2026 window. Nine screens in all: Unseen XI, profile, story opportunity, kit, localisation, route and publish, creator brief, fan feed, impact.

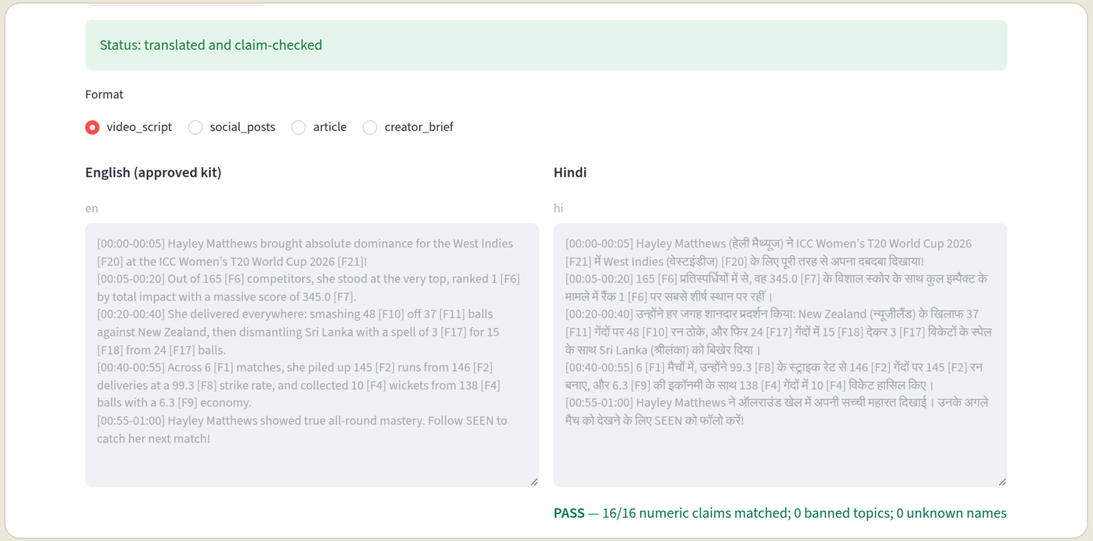

THE PROTOTYPE · 2 OF 3

Verify every number, then take the story to her market

Story kit with the claim checker in front

Eight formats from one fact bundle: prose by the model, numbers by the code, every figure carrying a fact ID. Here an editor added "200 runs in the final"; the checker blocks publication until the number matches a fact or the sentence goes.

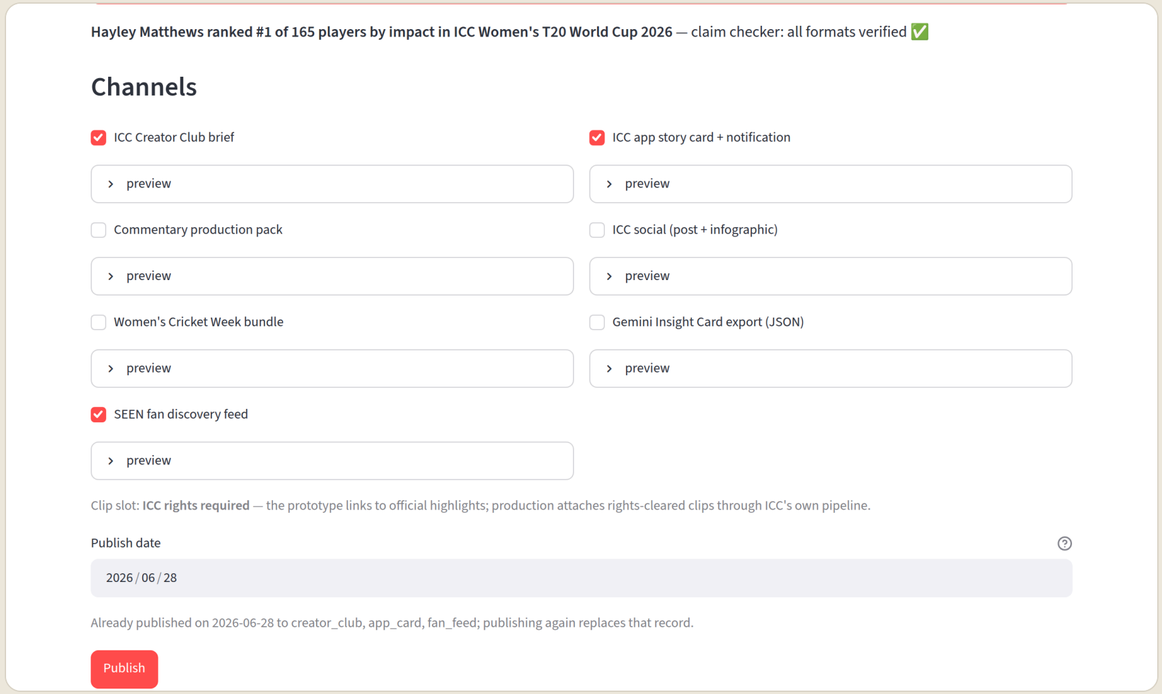

Localisation, re-checked

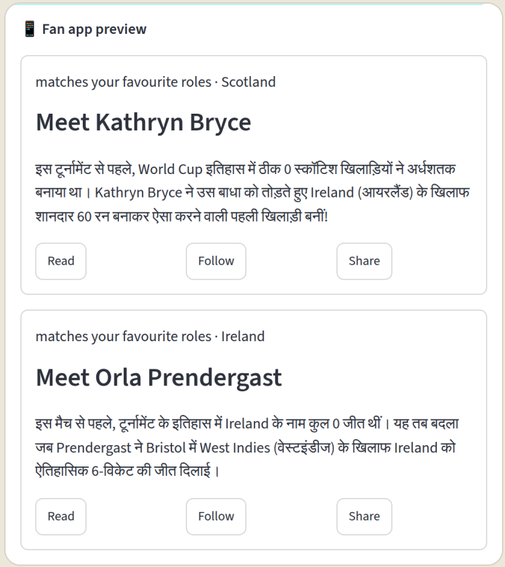

Languages ranked by opportunity, then a translation that keeps a locked cricket glossary, keeps her name in both scripts, and goes back through the claim checker before anyone sees it. Hindi for Matthews: 16 of 16 claims matched.

Model prose is optional: without an API key the same kits are built from templates, and the claim checker runs either way. Banned topics in every kit: health or injury speculation, private life, betting, religion, appearance.

THE PROTOTYPE · 3 OF 3

Route it through ICC's own pipes, and reach the fan in her language

Route and publish

One verified kit, one click: Creator Club brief, app card, commentary pack, social, Women's Cricket Week bundle, Gemini card export, fan feed. Publishing unlocks only when every format passes; each publication is logged.

Fan discovery feed

Athlete-first cards in the fan's language, a reason on every card, slots for the under-seen; every read and follow is logged.

Nothing here is a measured outcome of a real campaign. The prototype's own measurement, difference-in-differences against matched controls, is shown with the pre-registered metrics on the impact slide.

WHERE GEMINI DOES THE WORK

Three jobs for the model — and the one job it never gets

01

Write from a fact bundle

Gemini turns 15–25 sourced facts into a 60-second script, social posts and an article; the five template formats stay deterministic. Every number must keep its citation, e.g. 60 runs [F4].

02

Translate with a locked glossary

Hindi and Urdu kits with cricket terms and names held fixed; the languages are chosen by market gap, and each translation is re-checked before the fan feed serves it.

03

Rewrite live, with an angle

In the hosted app an editor asks for a new draft — "for a first-time fan in Lahore", "for a commentator" — and Gemini answers in seconds. Facts and citations do not move.

✕

Never the numbers

A deterministic claim checker reads every draft, matches each figure to a fact ID and blocks the draft if one is missing or wrong. "97 runs and 9 wickets" → BLOCKED. A blocked draft is shown to the editor, never published.

This run: 11 kits · 224 facts · 88 formats · 1,123 numeric claims checked, 0 unverifiable in the published kits · model prose and Hindi/Urdu translations for the featured athletes, re-verified after generation.

gemini-3.8-flash via google-genai · low temperature · JSON-only answers · prompt cache by content hash, so a re-run costs nothing.

BUILT ON GOOGLE CLOUD

One container on Cloud Run, Gemini behind it, nothing a judge cannot open

PUBLIC DATA IN

Cricsheet ball-by-ball JSON (3,577 women's matches)

Wikidata identities · **Wikimedia Pageviews** in 8 language editions

No scraping, no private data, no keys needed for the data layer.

→

PIPELINE (BATCH)

DuckDB graph → 10 patterns → significance → gap model → Unseen XI

Gemini writes the kits and translations; the **claim checker** verifies them

Runs from one command; weekly on **Cloud Scheduler** in production.

→

SERVING

Cloud Run service (asia-south1): the Streamlit app with the analysed data baked into the image; session affinity, one warm instance, scales to zero after judging

Gemini API via google-genai for live rewrites and translations · key in **Secret Manager** · image built by **Cloud Build** from the Dockerfile

---

Production path on Google Cloud: Gemini on Vertex AI with provisioned throughput · Firestore for fan events and the publish log · BigQuery for the attention index and the difference-in-differences measurement · Cloud Scheduler for the weekly run · Cloud Run jobs for the pipeline.

Deploy: **gcloud run deploy seen --source .** — reproducible from the repository in about five minutes.

WHY ICC, WHY NOW

Only ICC can run a neutral index across 110 members and put it in front of 350 creators the same morning.

ICC owns the inputs

Official event data and footage (Stats Perform feed to 2027) as the upgrade path; the long tail of 98 Associates that no board's media team reaches; the neutrality no single board has.

ICC owns the pipes

ICC.tv; the ICC app and web, 8.5m unique users during the 2025 World Cup; a 350-creator Creator Club; production in 14 languages; Women's Cricket Week; the Google partnership for women's cricket.

ICC owns the calendar

U19 Women's T20 World Cup, Jan–Feb 2027 · Women's Champions Trophy 2027 · Women's T20 World Cup 2028 · the LA28 build-up. Between them: WBBL, WPL and The Hundred keep the graph warm.

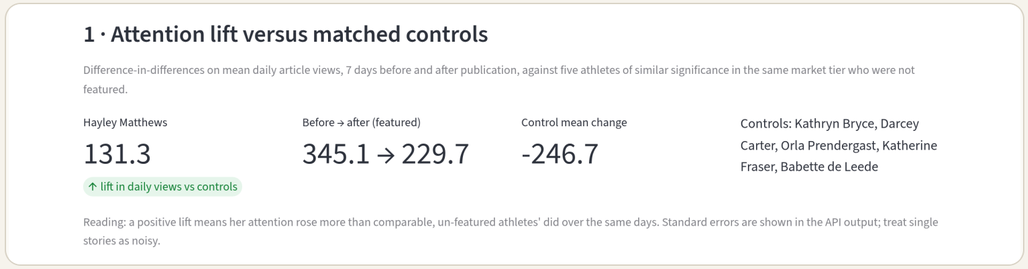

Why now. Open data is sufficient (Cricsheet, Wikimedia), model cost has collapsed, and Gemini insight cards and the Creator Club are ready surfaces.

The layer above the incumbents. Gemini cards, Opta feeds, WSC clips and IBM-style companions supply the *what*. SEEN decides *who* and *why*, in which language — and measures whether it worked.

WOMEN'S IMPACT

Every metric pre-registered; none claimed yet

Who	Mechanism	What SEEN measures
Athletes	Weekly pick by gap; verified kits; consent	Lift vs matched controls; followers; new-language articles
Associate boards	Player stories without a media team	Share of featured Associates; reach in new markets
Fans	Athlete-first discovery in their language	Athletes followed per fan; follow conversion; returns
Creators	Verified briefs, angles and assets	Kit uptake; views per kit vs creator baseline
Broadcasters	Storyline packs and milestone watch	Packs opened per match; names said on air (audit)
Countries, languages	Inclusion constraints; localisation by gap	Attention growth by country; first local-language articles

The measurement runs today. Difference-in-differences on daily article views, seven days before and after a publication, against five matched athletes who were not featured. On the left, the method on a back-dated demo publication: a demonstration, not a result.

Baselines already measured: the top 10 athletes hold 40% of attention and the top 20 hold 58% (Gini 0.69); average views per player run from 24,055 for India to 1,238 for Sri Lanka. Success is a flatter curve without taking anything from the stars.

The prototype's fan funnel counts real session events; its simulated view is labelled as such. Lift figures on the demo screen come from historical data around a date chosen for the demonstration.

BUSINESS MODEL AND SUSTAINABILITY

A product ICC, boards, broadcasters and sponsors will pay for

ICC

Platform licence: graph, gap index, Unseen XI, kits, routing, dashboard. Annual fee plus per-event modules; the pilot priced at cost. Delivers KPIs for the women's strategy and measurable outcomes for partners.

Boards and leagues

League edition for WPL, The Hundred and WBBL: the between-event engine for their own players. Season licence tiered by size; Associate access funded through ICC development grants.

Broadcasters

Storyline feed, commentary packs and milestone watch per event, with per-language add-ons: better on-air storytelling for women's matches at near-zero research cost.

Sponsors

"Unseen XI presented by ..." packages sold by ICC with a revenue share, plus rising-athlete opportunity reports: evidence-backed access to athletes brands under-buy, before prices rise.

Sustainable by design. Fewer, better stories cost less than volume content. The public-data index runs with no partner data at all, on open licences (Cricsheet ODC-BY, Wikimedia), with about 33 short model calls per weekly run.

Inclusive by construction. The XI's constraints guarantee Associates and small markets a place every week; localisation is ranked by gap, not by market size.

SCALE-UP

Five phases, each gated by a measured result

1 · Nov–Dec 2026

Public index

Weekly public Unseen XI from open data during the WBBL; read-only API; kits in three languages; no ICC dependency.

Gate: four weekly releases; lift vs controls in at least one week.

2 · Jan–Feb 2027

Two pilots

U19 Women's T20 World Cup: commentary packs and dashboard only, no spotlight on minors without board consent. WPL 2027: the full loop with Hindi kits.

Gate: creator uptake and follow conversion measured; one sponsor package committed.

3 · 2027

ICC deployment

Women's Champions Trophy: Creator Club integration, app cards, official data feed, milestone watch, sponsor packages.

Gate: lift and breadth reported to the ICC Board; Associate floor met every week.

4 · 2028

Global scale

Women's T20 World Cup 2028 and the LA28 build-up: all women's ICC events plus men's Associates; athlete accounts; multi-region infrastructure.

Gate: platform licence renewed; two board editions live.

5 · 2028 onward

Cross-sport

Ontology packs for women's rugby and football, one federation each; the same graph, gap and measurement logic.

Gate: a second federation pays for a season.

Phase 0 is this submission: a prototype on 2026 T20 World Cup and league data, one end-to-end journey, a real gap ranking, 100% of demo kits verified.

TEAM AND NEXT STEPS

Two people, a working prototype on public data — and the road to a product

Sainath Gaikwad

QA engineer. Product, data pipeline and verification: the graph, the gap model, the claim checker and the app.

Sharvari Otari

Senior Java developer. Narrates the demo video; review of the story kits, the localisation flow and the submission.

Everything rebuilds from public sources with one command and deploys to Cloud Run with one more; the repository and the live URL are in the submission.

After the Cup: three gated steps

1. Weekly public Unseen XI through the WBBL (Nov–Dec) on Cloud Scheduler + Cloud Run jobs, kits in three languages, a read-only API for creators.
2. A measured pilot with a rights-holder (ICC Creator Club or a Member board): one brief slot a week, attention lift against matched controls as the gate.
3. A consent and opt-out workflow agreed with the boards before any athlete is featured; no minors without board consent; Gemini on Vertex AI with provisioned throughput for production volumes.

Live prototype and the 3-minute demo video are linked in the submission form · Architecture, data strategy and risks in the appendix · Cricsheet (ODC-BY); Wikidata and Wikimedia pageviews (CC0).

APPENDIX A · ARCHITECTURE

Every AI component: what runs today, and its production path

Component	MVP (running today)	Production
Entity resolution	Cricsheet register → Wikidata → titles in 8 editions	Official IDs; review queue for leftovers
Narrative patterns	10 SQL rules: firsts, wins, all-round, milestones	15 rules incl. venue, diaspora, head-to-head
Significance	rarity 0.35 · stakes 0.20 · magnitude 0.30 · arc 0.15	Regressor trained on outcome data
Attention index	Wikimedia pageviews, 8 editions, 60-day baseline	+ ICC app, ICC.tv and YouTube analytics
Visibility gap	Two OLS lines: performance-only gap + decomposition	Hierarchical by market; confidence bands
Unseen XI	Greedy pick under country/role/consent/cooldown	Integer programme; editor override
Compiler + checker	Template or LLM prose; numbers by code; regex checker	+ LLM claim extraction; editor approval
Localisation	Glossary-locked LLM translation, re-checked	Indic TTS voices; human review in pilot
Fan feed · impact	Rules + exploration slots · diff-in-diff vs controls	Contextual bandit · interrupted time series

Stack: Python, DuckDB, pandas, Streamlit; every API response cached; runs on a laptop from one command. Deliberately not used: blockchain, computer vision on footage, biometric or health data.

APPENDIX B · DATA STRATEGY

Public data first; ICC data as an upgrade

A · Usable now

Cricsheet ball-by-ball JSON, 3,577 women's matches (ODC-BY). Cricsheet register → Wikidata → Wikipedia in 8 languages. Wikimedia Pageviews API, daily. GDELT news counts, optional.

B · ICC data that upgrades it

Official Stats Perform feed for same-day facts; ICC app and ICC.tv engagement events for measurement; Creator Club uptake; rights-cleared clips through ICC's own pipeline.

C · Deliberately not used

No scraping of ESPNcricinfo or Cricbuzz (Disney terms). No personal, health or private-life data. No betting content. No minors featured without board consent.

D · What SEEN creates

A canonical athlete graph with cross-references; a weekly gap-index history; verified kits with fact IDs; a publication log; lift estimates with uncertainty.

Safeguards in the code path. Consent gate and opt-out before selection; 14-day cooldown; claim checker on every format and every translation; banned-topic list; editor approval before publication; attention data flagged incomplete is excluded from the fit.

Evidence labels used throughout. Verified (fetched public data) · Assumed (documented heuristics: market tiers, language scores) · Hypothesis (attention lift) · Simulated (the prototype's demo funnel).

APPENDIX C · RISKS AND RED TEAM

What could go wrong, and what would change our mind

Risk	Likelihood / impact	Mitigation, built or planned
Wikipedia views mismeasure attention	Medium / high	Relative ranks; per-athlete confidence; ICC data in pilot
Generated text contains an error	Low / high	No model-written numbers; claim checker; editor approval
Read as "just a content generator"	Medium / high	Lead with gap and XI; generation is one step of six
Athlete declines spotlight, or abuse	Medium / high	Consent gate, opt-out, abuse review, no minors
Boards object to a public ranking	Medium / medium	Opportunities, not league tables; editor override
Official data exclusivity	Medium / medium	Cricsheet-first; official feed under ICC's licence

Red-team verdict on the concept: accepted with two conditions — the gap must be real (measured: it is) and the measurement must be honest (pre-registered metrics, labelled evidence).

What would change our mind: no lift versus matched controls across four consecutive weekly releases. SEEN would then stay a measurement tool, and story generation would be dropped.

APPENDIX D · EVIDENCE AND SOURCES

Where every number in this deck comes from

Our own measurements (verified, reproducible)

Impact and attention ranks, views, shares, R^2 values, the Unseen XI and all claim-check counts: the SEEN run of 26 Sep 2026 on Cricsheet data (3,577 women's matches, ODC-BY) and the Wikimedia Pageviews API (8 editions, baseline 13 Apr–11 Jun, window 12 Jun–5 Jul 2026), 165 athletes of the ICC Women's T20 World Cup 2026.

Assumed, hypothesis, simulated

Market tiers and language opportunity scores are documented heuristics. Attention lift and follow conversion are hypotheses to be measured in pilot. The prototype's demo fan funnel is simulated and labelled.
